

Patterns that break

Peter Rowlett

Sheffield Hallam University

`p.rowlett@shu.ac.uk`

- ▶ A number's prime factorisation is when we write the number as a product of its prime factors.
- ▶ For example,
 - ▶ $6 = 2 \times 3$;
 - ▶ $18 = 2 \times 3 \times 3$.
- ▶ Notice 6 has an even number of factors and 18 has an odd number of factors.
- ▶ Let $E(n)$ be the size of the set

$$\{k \in \mathbb{Z}^+ \mid 2 < k \leq n \wedge k \text{ has an even number of factors}\}$$

- ▶ Let $O(n)$ be the size of the set

$$\{k \in \mathbb{Z}^+ \mid 2 < k \leq n \wedge k \text{ has an odd number of factors}\}$$

n	No. factors	$E(n)$	$O(n)$
1	0	1	0
2	1	1	1
3	1	1	2
4	2	2	2
5	1	2	3
6	2	3	3
7	1	3	4
8	3	3	5
9	2	4	5
10	2	5	5

n	No. factors	$E(n)$	$O(n)$
1	0	1	0
2	1	1	1
3	1	1	2
4	2	2	2
5	1	2	3
6	2	3	3
7	1	3	4
8	3	3	5
9	2	4	5
10	2	5	5

- In 1919, Pólya conjectured $O(n) \geq E(n)$ for all $n > 1$.
- Pólya checked this up to $n = 1500$.

n	No. factors	$E(n)$	$O(n)$
1	0	1	0
2	1	1	1
3	1	1	2
4	2	2	2
5	1	2	3
6	2	3	3
7	1	3	4
8	3	3	5
9	2	4	5
10	2	5	5

- ▶ In 1919, Pólya conjectured $O(n) \geq E(n)$ for all $n > 1$.
- ▶ Pólya checked this up to $n = 1500$.
- ▶ In 1962, a counterexample was found.
- ▶ The smallest counterexample is $n = 906, 150, 257$.

- ▶ There are lots of these. Here are just a few.
 - ▶ Fermat conjectured $2^{2^n} + 1$ is prime for all n , but Euler showed $2^{2^5} + 1 = 4294967297 = 641 \times 6700417$.

- ▶ There are lots of these. Here are just a few.
 - ▶ Fermat conjectured $2^{2^n} + 1$ is prime for all n , but Euler showed $2^{2^5} + 1 = 4294967297 = 641 \times 6700417$.
 - ▶ 12 is not prime. 121 is not prime. 1211 is not prime. 12111 is not prime. This continues until you have 136 1s following the 12.

- ▶ There are lots of these. Here are just a few.
 - ▶ Fermat conjectured $2^{2^n} + 1$ is prime for all n , but Euler showed $2^{2^5} + 1 = 4294967297 = 641 \times 6700417$.
 - ▶ 12 is not prime. 121 is not prime. 1211 is not prime. 12111 is not prime. This continues until you have 136 1s following the 12.
 - ▶ Consider the first n primes. There are more primes that are one less than a multiple of 3 than primes that are one more than a multiple of 3. Until $n = 23338590792$.

- ▶ There are lots of these. Here are just a few.
